

Item description/product images

Description

Material:

Body and jaw steel. Limit stop aluminium.

Version:

Body black oxidised.

Jaws nitrocarburised and black oxidised.

Limit stop black anodised.

Note:

The floating clamp is used to clamp and support overhanging clamping points on components. It prevents vibrations and deflection during machining.

Type of operation:

- 1. Push the floating clamp down.
- 2. Pivot the jaws up to the stop. Now the floating jaw of the floating clamp should rest against the underside of the workpiece.
- 3. Tighten the floating clamp with the hex nut (observe the min. and max. tightening torque). During clamping, the workpiece is clamped and simultaneously supported.
- 4. To release, perform the procedure in reverse order.

Assembly:

Set the height range and the pivot range, then attach the floating clamp to the bracket using the holes (D1).

When setting the height, a generous allowance above should be taken into account. Form B:

For special clamping applications, the standard clamping jaw can be modified or replaced.

Drawing reference:

- 1) Exchangeable jaw
- 2) M6 ISO 4762 cap screw
- 3) Fastening point for clamping jaw
